

White Stallion is One of the Dirtiest New Coal Plant Proposals in Recent Texas History

White Stallion Emissions Comparison
Compared to 6 other plants currently in permitting
or recently permitted in Texas.

CO₂, SO₂, and NO_x comprise the largest amount of toxic emissions from coal plants.

While carbon dioxide (CO₂) is not yet regulated by TCEQ as a pollutant, the EPA has released an endangerment finding as well as announced it will begin to regulate CO₂ as a pollutant, congruent with the 2007 Supreme Court decision “Massachusetts vs EPA” which ruled that CO₂ was a pollutant and that EPA had the authority to regulate it as such.

Industrial releases of CO₂ are causing acidification of our oceans, bleaching coral reefs and contributing to the collapse of fisheries worldwide. White Stallion has made no commitments to reduce or mitigate CO₂ emissions and will be releasing just as much carbon dioxide as any other similarly-sized coal plant.

SO₂ – tons per year

1. Las Brisas	8,096
2. <u>White Stallion</u>	<u>4,956</u>
3. Limestone	3,386
4. Spruce	3,363
5. Coletto Creek	3,236
6. Tenaska	2,910

NO_x – tons per year

1. <u>White Stallion</u>	<u>4,048</u>
2. Las Brisas	3,776
3. Limestone	2,822
4. Spruce	2,803
5. Coletto Creek	2,697
6. Tenaska	2,425

Sulfur Dioxide, or SO₂, is a toxic pollutant found whenever coal is burned. It contributes to acid raid and the acidification of soils and waterways.

Nitrogen Oxides, or NO_x, are the main components of smog, which harms air quality and contributes to asthma and other respiratory conditions.
